QUESTION 1

What is the correct way to access data from Fusion Apps in your AppUI extension?

- A. Use a service from the service catalog.
- B. Define a new service endpoint providing the direct service URL.
- C. Establish a JDBC connection to the Oracle Fusion Apps database.

Correct Answer: A

The correct way to access data from Fusion Apps in your AppUI extension is to use a service from the service catalog. The service catalog is a list of predefined service connections that are available for your AppUI extension. These service connections allow you to access and manipulate data from Fusion Apps using REST APIs. You can browse the service catalog and select the service that matches your data needs. References: : Service Catalog in Visual Builder Studio : Accessing Data from Fusion Apps in Visual Builder Studio

QUESTION 2

You are asked to refer to the Redwood Pattern Book before developing the Redwood application.

Which three pieces of information are included in the Pattern Book? (Choose three.)

- A. Template introduction
- B. Pictorial representation of data
- C. User manual for Use Cases
- D. Specific page functionality
- E. Composites and components

Correct Answer: ABE

The Pattern Book is a collection of templates and patterns that provide guidance and best practices for developing Redwood applications. It includes a template introduction that explains the purpose and usage of each template, a pictorial representation of data that shows how to visualize data in different scenarios, and composites and components that describe the common elements and interactions of Redwood UIs . References: : Oracle Redwood Pattern Book : Oracle Redwood Design System

QUESTION 3

The Redwood template your page is based on has a primary action button.

How do you control what it does?

- A. Create an action chain mapped to the template's primary action event, at the template level.
- B. You cannot. The functionality is determined by the original template.

- C. Remove the existing button from the template and add your own.
- D. Create an onAction action chain on that button.

Correct Answer: A

The primary action button is a UI component that represents the main action that the user can perform on a page. It is usually located at the top right corner of the page and has a prominent color and style. The primary action button is defined by the Redwood template that your page is based on, and its functionality is determined by an action chain mapped to the template's primary action event at the template level. You can create or modify this action chain to control what the primary action button does on your page . References: : Primary Action Button in Redwood Pattern Book : Action Chains in Visual Builder Studio

QUESTION 4

How many instances of Oracle Visual Builder Studio are provisioned with your Oracle Fusion Cloud Applications Tenancy?

- A. Multiple - for each DEV instance in your tenancy
- B. None - you need to provision one manually
- C. One - mapped to your production Fusion Apps instance
- D. One - mapped to a TEST instance of Fusion Apps in your tenancy

Correct Answer: C

When you subscribe to Oracle Fusion Cloud Applications, you get one instance of Oracle Visual Builder Studio provisioned with your Oracle Fusion Cloud Applications Tenancy. This instance is mapped to your production Fusion Apps

instance and allows you to create and deploy extensions for your Fusion Apps pages. You can also use this instance to access other instances of Fusion Apps in your tenancy by creating sandboxes for them .

Working with Sandboxes in Visual Builder Studio

QUESTION 5

In which three cases would you need a Visual Builder service instance to deploy your app to? (Choose three.)

- A. When the app needs to be accessed by users who do not have Fusion Apps access
- B. For gaining access to an external database through a REST service requiring basic auth
- C. When there is an application that is accessible from a vanity URL (Custom domain)
- D. For gaining access to Oracle Fusion Apps REST services
- E. For enabling the app to be integrated into the Fusion Cloud Apps menu

Correct Answer: ACD

You would need a Visual Builder service instance to deploy your app to in three cases:

When the app needs to be accessed by users who do not have Fusion Apps access: If you want your app to be available to users who are not authorized to access Fusion Cloud Apps, you need to deploy it to a stand-alone VB instance that

has its own user management and security policies. When there is an application that is accessible from a vanity URL (Custom domain): If you want your app to have a custom domain name that is different from the default VB instance URL,

you need to deploy it to a stand-alone VB instance that supports custom domain configuration.

When gaining access to Oracle Fusion Apps REST services: If you want your app to access the REST services provided by Fusion Cloud Apps, such as querying or updating data, you need to deploy it to a VB instance that is connected to

the FA instance and has the appropriate security roles and permissions. Therefore, options A, C, and D are the correct answers. References: [Deploying Visual Builder Apps], [Accessing Fusion Applications REST Services]
